

Where does Photoshop Look for ICC Profiles?

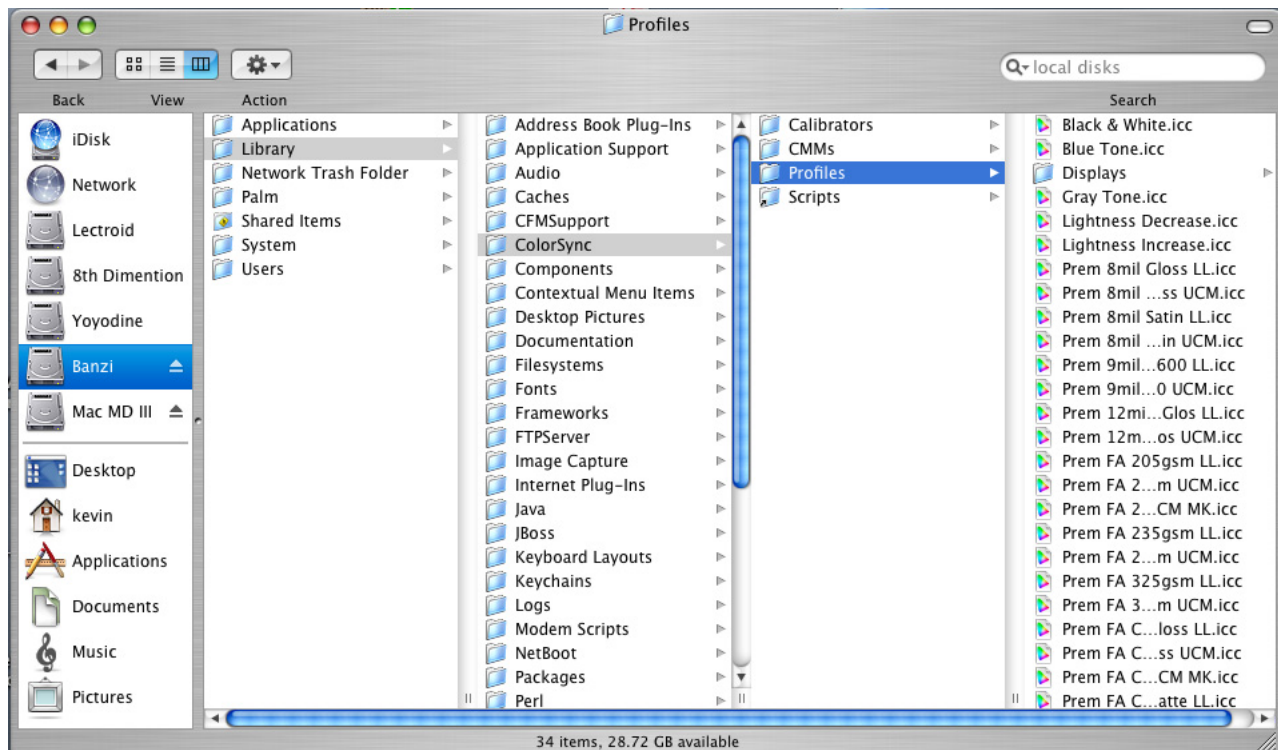

To use any RGB ICC profile with the Epson Stylus Pro 4000, 7600 or 9600 driver, you must first place them in the proper location on your computer.

ICC Profiles work identically on both Macintosh and Windows platforms.

Here is where you copy the .icc files to on your **Startup Disk**:

Operating System	ICC File Location
Mac OS 9.2.2	System Folder/ColorSync Profiles
Mac OS X	Library/ColorSync/Profiles
Windows 98 & Me	Windows/System/Color
Windows 2000 & XP	Windows/System32/Spool/Drivers/Color

Example: Mac OS X

If the profiles don't show up in Photoshop right away, try restarting the application. If they still don't appear, try restarting the computer.

All Profiles were created at 1440 dpi unless otherwise noted (profiles are resolution specific).
